Applicant's remarks concerning the restriction requirement have been carefully considered. Since it has been demonstrated that different and unique searches are required for each invention it would present a serious burden for the Office to perform all searches in one application. The restriction requirement is deemed proper and is therefor made FINAL.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 12-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Barker in view of Mizuno et al.

Barker employs a method of installing optical fiber in an an installation tube by blowing compressed inert gas as the fiber is advanced within the tube.

Mizuno et al teaches that friction between relatively movable members in confined spaces such as an agitating tank produces static electricity. Mizuno et al reduces or eliminates static electricity by blowing ionized gas into the confined space such as the agitating tank.

Since Barker installs optical fiber in the confined space of an installation tube it is reasonable and obvious in view of Mizuno et al to expect that static electricity will be building up inside the installation tube as the fibers are blown through the installation tube. To therefor use ionized compressed gas in lieu of the inert gas in Barker would have been obvious in view of the teachings of Mizuno et al. One skilled in the art would

have been motivated to do this in order to eliminate static electricity build up inside the installation tube as the optical fibers are blown through the installation tube to prevent explosions, build up of contaminants, friction and other undesirable effects of static build up. In Mizuno et al the compressed gas is ionized therefor the gas is compressed before being ionized.

Claims 15-31 are withdrawn from further consideration pursuant to 37 CFR 1.142(b), as being drawn to a nonelected invention, there being no allowable generic or linking claim. Applicant timely traversed the restriction (election) requirement in the reply filed on 7/29/08.
